Summary

Platform & Developer Experience engineer modernizing legacy systems and internal tooling. Led SSO migrations (12k+ users), server/database consolidation (10 to 6 nodes; Postgres 12 to 15), and documentation/automation that cut toil by 87%, and doubled indexing performance. Ex-Support Lead turned solutions engineer; I unblock teams and make platforms humane.

Experience

Sr. Computer Specialist (Atlassian Platform Engineer), University of Washington – Seattle, WA April 2024 – Current

- Amid a broken SSO after years of neglect, replaced a legacy custom plugin with vendor-supported SAML/OIDC, rebuilt IdP/SP trust, and normalized attribute mapping; restored secure authentication for 12k+ users and reduced long term maintenance risk.
- Facing InfoSec firewall mandates and OS/DB EOL, re-architected LucidChart/Google Drive integrations and upgraded Centos 7 to Ubuntu 22.04 & Postgres 12 to 15 via staged/rollbackable cutovers; restored plugin functionality, met audit policy, and reduced DC footprint from 10 to 6 with no capacity loss.
- With indexing throughput throttling delivery, tuned JVM/GC, rebalanced indexing, and adjusted Postgres parameters (autovacuum/work_mem); increasing Jira indexing performance by ~200% and stabilized search behavior under load.
- Amid ad-hoc production changes and incident churn, introduced a lightweight change-management path (gates, templates, runbooks) and enforced rollout windows; cut unsanctioned “tests in prod” and unscheduled maintenance by ~50%.
- Tasked to remove single points of failure and meet vendor support posture, designed and led Server 7.x to Data Center LTS migration (pilots, parallel index, staged cutover, tested backups/restore); completed phased migration and hardened recovery posture.
- To scale knowledge transfer and self-service, authored an Atlassian guidebook and delivered targeted enablement sessions; accelerated team proficiency and reduced recurring support requests for common admin workflows.

Senior Technical Support Engineer, Carbon Robotics – Seattle, WA

June 2022 – April 2024

Promoted from Technical Support Engineer to Senior in June 2023

- Facing inconsistent project tracking across teams, led a company-wide Jira Software rollout via a four-phase release, standardizing workflows and boosting cross-team visibility.
- With documentation scattered across tools, drove a two-phase Confluence implementation and enablement campaign, achieving 100% org adoption and eliminating scattered documentation.
- To reduce configuration drift and ramp time, authored technical design docs and training for Jira and Jira Service Management, improving onboarding and admin consistency.
- To cut support-account handling overhead, built two internal tools: a Flask service and a Laravel App with Redis scheduling, integrating legacy systems, reducing handling time by 20%.
- For an application rewrite, served as prototype designer and product coordinator, guiding a TypeScript and Go MVP that accelerated development and clarified technical direction.
- To speed knowledge transfer, authored core runbooks and product documentation, equipping support teams with self-service resources.
- Eliminated manual weekly reporting by automating Customer Performance Reports, reducing effort by 87% and surfacing product-usage insights.
- Amid rapid growth, designed and delivered an onboarding program that fully integrated 7 engineers in <4 weeks.
- To meet rising customer demand, scaled the support engineering function from 2 to 10 and transitioned coverage from 6x16 to 7x24, improving responsiveness and customer satisfaction.

Promoted from Technical Support Engineer to L3 Advanced Support Engineer in May 2021

- With new-hire ramp up uneven and satisfaction lagging, redesigned global training with role-based paths, labs, and a shadowing matrix, improving ramp-up and satisfaction by 45%.
- Recurring escalations lacked clear first-response playbooks, authored diagnostic guides and fault-isolation steps, improving triage quality and reducing hand-offs.
- When incidents required deep analysis across services, performed root-cause investigations using MySQL queries and the Ruby (Rails) codebase, partnering with engineering to land durable fixes.
- Documentation was scattered and aging; re-implemented the internal knowledge base in Confluence and Salesforce Knowledge with standardized templates, improving documentation accessibility by 15%.
- Release cycles surfaced late regressions, supported unit, integration, and smoke testing, and contributed test plans, catching issues earlier and smoothing hand-offs to Support.
- Visibility into customer-impacting signals was limited; built queries and dashboards in Kibana and Grafana, speeding detection and shortening time-to-diagnose.

Projects

Lead Product Developer & Creator – Acolyte LMS (v4)

May 2017 – May 2022

- Built a modular LMS with Stripe in-app payments and a custom RBAC system; designed for multi-tenant use and auditability.
- Scaled to 50+ active users across multiple clients, supporting hybrid learning cohorts for 3+ years.
- Implemented backend on Laravel + MySQL with Amazon S3 for asset storage; shipped content authoring, assignment/grading workflows, and automated backups.
- Established operational runbooks and environment parity for local/stage/prod, improving release safety and rollbacks.

Lead Product Developer & Creator – Acolyte LMS (v5)

May 2022 - Current

- Developing native standards support: SCORM 1.2/2004 runtime, xAPI, and cmi5 for broader content compatibility and vendor neutrality.
- Implementing granular RBAC and data-governance features (export/erasure flows) to align with GDPR and least-privilege principles.
- Designing a learner-diagnostic module using rules-based assessments with reporting and instructor/student dashboards; currently in planning.
- Modernizing the stack for maintainability and speed (TypeScript-forward front end; service boundaries; CI scripts and automated migrations).

Publications

-
- *A Warrior's Journey* – Author (2024), Barnes & Noble; ISBN 9798218480882

Skills

Languages: TypeScript, JavaScript, PHP, Java (8, 11, 17), Python, SQL

Frameworks & Libraries: Laravel, Flask, Ruby on Rails, React, Next.js, Tailwind CSS, Vite

Platforms & Infrastructure: Linux (Ubuntu 20.04 – 24.04, Centos7 – Stream, Arch Linux), Docker, Nginx/Apache, systemd, Git, GitHub, GitLab

Atlassian & Knowledge Systems: Jira Cloud & Data Center, Jira Service Management, Confluence Cloud & Data Center, Salesforce Knowledge

Identity & Access: SSO (SAML, OIDC), LDAP, RBAC, GDPR-aligned data governance

Observability & Logging: ELK Stack, Grafana

Data Stores: PostgreSQL (12 – 15), MySQL, Redis, SQLite, S3-compatible object storage
